

Premium 360° Portfolio — Master Build Prompt

Complete build prompt + recommended AI, design, 3D, animation and deployment tool stack.

1. PROJECT GOAL

Build a premium, highly interactive personal portfolio for a creative full-stack developer. It should feel like a luxury editorial website + creative developer portfolio + interactive product showcase + premium agency website. Avoid generic templates, SaaS-dashboard styling, excessive gradients, unnecessary cards, stock developer illustrations and decorative effects without purpose.

2. TOOLS TO USE

AI / BUILD: Antigravity for AI-assisted coding and project iteration; Lovable for rapid full-stack prototyping when useful; ChatGPT for architecture, debugging, prompts and content. DESIGN: Figma for layouts, typography, design system and responsive planning. 3D / VISUAL: Blender for custom 3D assets when needed; Three.js + React Three Fiber for browser-based 3D; GSAP for cinematic motion. MOTION: GSAP + ScrollTrigger for scroll-linked sequences; Lenis for smooth scrolling; Framer Motion for UI micro-interactions; Lottie for lightweight motion graphics when appropriate. ASSETS: Spline can be used for interactive 3D scenes when a no-code 3D workflow is faster. IMAGE / VIDEO: use an image-generation or video-generation tool to create supporting visual assets when needed, while keeping the portfolio's hero implementation hidden. DEVELOPMENT: VS Code / Antigravity, Git and GitHub. DEPLOYMENT: Vercel for frontend deployment; Render or another suitable backend host if a backend is required.

3. TECH STACK

Frontend: React, TypeScript, Vite, Tailwind CSS. Animation: GSAP, ScrollTrigger, Framer Motion, Lenis. Icons: Lucide React. Immersive visual presentation: Three.js / React Three Fiber where genuinely useful. Use reusable components, clean architecture, responsive desktop/tablet/mobile design and prioritize performance.

4. GLOBAL DESIGN

Premium, minimal, editorial, cinematic, modern, creative and sophisticated. Use large expressive typography, strong hierarchy, generous whitespace, thin borders, subtle shadows, smooth transitions and elegant micro-interactions. Avoid excessive rounded cards, rainbow gradients, generic blobs, excessive floating elements and cheesy animations.

5. NAVBAR

Minimal sticky navigation. Left: SRI / personal logo. Right: About, Work, Skills, Services, Contact. CTA: Let's Work Together. Initially transparent; on scroll add subtle background, blur and thin border. Mobile uses a premium fullscreen menu.

6. HERO — MOST IMPORTANT

Create a full-screen cinematic hero. Use the provided woman reference image as the exact visual reference. Preserve face, facial features, hairstyle, skin tone, white shirt, jewelry, proportions and identity. Show ONLY a large half-body / upper-body portrait. Subject occupies about 75–85% of viewport height and remains perfectly centered. No text, names, logos, watermarks or graphics on the visual itself.

7. COMPLETE 360° SCROLL

Create a TRUE COMPLETE 360-degree rotation controlled by scroll. Sequence: 0% front → 12% 3/4 → 25% side → 37% 3/4 back → 50% back → 62% opposite 3/4 back → 75% opposite side → 87% 3/4 front → 100% exact original front. Final frame must match initial frame. Keep subject large, centered and constant in scale.

8. SCROLL BEHAVIOR

Pin the hero visual while scrolling. Scroll down rotates forward; scroll up rotates backward. Use GSAP ScrollTrigger and Lenis. Rotation must be smooth, precise, linear, cinematic and directly synchronized with scroll. No automatic spinning, zoom, shake, jumps, perspective changes or scale changes.

9. HERO TEXT

Place minimal typography around the visual without covering the face. Example: CREATIVE DEVELOPER. Main: Building digital experiences that people remember. Supporting text: Full-stack developer focused on premium websites, interactive experiences and modern digital products. CTAs: View My Work / Let's Work Together.

10. HERO TRANSITION

Bottom indicator: SCROLL TO EXPLORE with a minimal arrow. Fade it out as scrolling begins. When 360° completes, transition smoothly into the next section.

11. ABOUT

Heading: More than a developer. Message: I build digital experiences that combine engineering, design and interaction. Mention full-stack development, AI-powered products, interactive web experiences, UI/UX and creative development. Editable stats: 400+ LeetCode Problems, 9.10 CGPA, 40K+ Community, 20+ Client Projects.

12. MARQUEE

Create a subtle horizontal marquee: FULL-STACK DEVELOPMENT / CREATIVE DEVELOPMENT / AI PRODUCTS / WEB DESIGN / INTERACTIVE EXPERIENCES. Keep it slow, smooth and refined.

13. SELECTED WORK

Use large editorial project presentations instead of tiny cards. Myntra Bharat AI — AI fashion experience; React, TypeScript, Golang, Gemini, Redis, GORM. KaabilAI — AI career navigation, ATS analysis, semantic matching, skill-gap analysis and learning roadmap. Hashira ATS — resume/JD analysis, missing skills, learning roadmap and project recommendations. Premium Client Websites — selected client work. Each project: large visual, title, category, technology, short explanation and View Project CTA.

14. PROJECT INTERACTION

On hover: image subtly scales, typography shifts, arrow moves and cursor interaction appears. Use GSAP/Framer Motion transitions without excessive effects.

15. SKILLS

Present interactive typography rather than percentage bars. Frontend: React, TypeScript, JavaScript, HTML, CSS, Tailwind CSS. Backend: Node.js, Express, Golang. Database: MongoDB, Mongoose, Redis. AI: Google Gemini, Generative AI, AI product integration. Tools: Git, GitHub, VS Code, Figma. Animation: GSAP, Framer Motion, Three.js, React Three Fiber, Lenis.

16. SERVICES — CLIENT FOCUSED

Heading: Let's build something worth remembering. Services: Premium Portfolio Websites; Business Websites; Interactive Websites; Landing Pages; AI-Powered Web Applications; Custom Full-Stack Development. Each service gets a short description, technology and subtle interaction.

17. WHY WORK WITH ME

Use concise editorial statements: Design + Development; Built around your brand; Responsive by default; Performance focused; Interactive when it matters; Made to create a strong first impression.

18. ACHIEVEMENTS

Include: 400+ LeetCode Problems; Algo University Fellowship; Myntra WeForShe HackerRamp 2026 — Top 100 Team; Internshala Student Partner; GFG GeekStreak; CodeChef Silver Badge; NxtWave Leadership Certificate; Mega GEN AI Workshop.

19. SOCIAL / COMMUNITY

Heading: Building beyond code. Highlight Sri Tech and the creator/community side. Mention content around development, careers, resumes, GitHub, AI and full-stack development. Keep presentation clean and premium.

20. TESTIMONIALS

Create an elegant testimonial section. Use only real testimonials/content supplied later. Do not invent testimonials.

21. CONTACT

Heading: Have an idea? Let's build it. Supporting text: Whether you're looking for a premium portfolio, business website or custom digital product, let's create something people remember. Primary CTA: Start a Project. Secondary: Let's Connect. Include email, LinkedIn, GitHub and Instagram. Form: Name, Email, Project Type, Message. Submit: Let's Build.

22. FINAL CTA

Create a dramatic minimal CTA: Your next website could look like this. Let's make it happen. Button: Start a Project →

23. FOOTER

Minimal footer. Left: Sri. Center: Built with curiosity + code. Right: © 2026. Include social links.

24. CUSTOM CURSOR

Desktop: small dot; interactive hover expands circle; project links show VIEW; images show EXPLORE. Disable on mobile.

25. ANIMATIONS

Use fade, subtle vertical movement, text masking, staggered typography, image reveal, horizontal movement and subtle parallax. Typical duration 0.5–1.2 seconds. Do not animate everything simultaneously.

26. 360° IMPLEMENTATION DETAIL

The hero should behave like an interactive 3D turntable controlled by scroll. Do not expose the implementation technique in the UI. The user should simply experience: Scroll → subject rotates 360°. The implementation may use optimized frame sequences, canvas, WebGL or another performant method. It must not look like a normal embedded video.

27. TOOL WORKFLOW

1) Figma — plan layout, typography and responsive design. 2) Antigravity — generate/refactor the React project and iterate quickly with AI assistance. 3) Three.js / React Three Fiber or optimized canvas — implement the immersive hero if needed. 4) GSAP + ScrollTrigger — map scroll progress to the 360° rotation. 5) Lenis — smooth scrolling. 6) Framer Motion — micro-interactions and UI transitions. 7) Blender/Spline — create supporting 3D assets only where they add value. 8) GitHub — version control. 9) Vercel — deploy the frontend. Keep the code modular so the hero can be replaced without rebuilding the whole site.

28. LOADING

Create a premium minimal loading experience: SRI → Loading experience... with progress. Preload critical hero assets. If assets are still loading, show a graceful fallback image.

29. PERFORMANCE

Lazy-load below-the-fold images; preload only critical hero assets; compress images; use WebP/AVIF where appropriate; avoid unnecessary JavaScript; use requestAnimationFrame appropriately; prevent scroll jank; use GPU-friendly transforms; avoid layout shifts; optimize mobile.

30. MOBILE

Do not simply shrink desktop. Create mobile-specific composition. Subject remains centered, large, half-body and visually dominant. Preserve 360° scroll experience. If full frame rendering is too expensive, use an optimized mobile asset strategy. Hero text must not cover the face. Use fullscreen mobile navigation.

31. ACCESSIBILITY & SEO

Use semantic HTML, keyboard navigation, accessible buttons, proper contrast, alt text and reduced-motion support. SEO title: Sri — Creative Full-Stack Developer. Description: Creative full-stack developer building premium websites, interactive digital experiences and AI-powered products. Add metadata, Open Graph, favicon and semantic headings.

32. FINAL QUALITY CHECK

Verify: full-screen hero; large centered half-body subject; complete 360° scroll rotation; exact start/end frame; no text/logo/watermark on visual; implementation technique hidden; smooth Lenis; GSAP ScrollTrigger; responsive design; fast loading; no layout shift; premium typography; visually dominant projects; strong client Services and Contact; accessibility; SEO; no generic template feeling.

33. BUILD ORDER — PERFECT HERO FIRST

Do not build every section at once. First perfect the HERO EXPERIENCE. The hero is the centerpiece. The 360° subject rotation must be extremely smooth and scroll-synchronized. Subject remains huge, perfectly centered and constant in scale. Rotation completes exactly 360° over the defined hero scroll distance. Do not fake it with a simple CSS rotation. Scroll position directly controls rotation progress. Once the hero is polished, build the remaining sections to match its design language.
